Lechler is a world leader in nozzle technology. For over 140 years, we have pioneered numerous groundbreaking developments in this field. Comprehensive nozzle engineering and in-depth understanding of application-specific requirements to create products that offer outstanding performance and reliability.

### Optimized cleaning processes
Companies all over the world in a wide range of industries rely on Lechler tank and equipment cleaning nozzles for thorough cleaning of all kinds of tank sizes, machines and equipment.

### Your advantages
- None of the risks, restrictions and costs related to manual tank cleaning
- Modern nozzle technology cuts cleaning fluid consumption and reduces downtimes
- The cleaning process is trouble-free, repeatable and verifiable

### New products for practically any application
The Lechler tank and equipment cleaning nozzle range features innovative drive concepts, state-of-the-art nozzle design as well as a large choice of sizes and materials. The scope of our portfolio is unique to the market and offers the perfect solution for every application.

### High cleaning performance at low pressure
Thanks to their sophisticated technology, Lechler tank and equipment cleaning nozzles already achieve high cleaning performance even at low pressures. This saves on high energy costs. The nozzles are driven and lubricated by the cleaning fluid and are therefore maintenance-free and reliable.

### Your experienced specialist – anywhere in the world
With subsidiaries in Hungary, the USA, England, India, China, France, Belgium, Sweden, Finland and Spain as well as qualified agents in over 40 countries, Lechler is represented all over the world. We will help you solve your cleaning problems – wherever you are.

### Industries
- Chemical industry
- Food & beverage industry
- Tank and equipment engineering
- Machine tool engineering
- Cosmetics industry
- Pharmaceutical industry
- Biotechnology
- Agricultural engineering
THE ART OF MAKING THE RIGHT CHOICE

Unique range of solutions

There is no one single perfect tank and equipment cleaning nozzle. That is because requirements differ greatly in each individual application. Over the course of the years, we have developed specialized nozzles for a wide variety of different purposes. Today we offer the world’s largest nozzle range. This includes everything from standard nozzles to individual nozzles for very specific tasks.

Cleaning efficiency at a sight

At first sight, finding the right nozzle for your particular application from the variety of nozzles we offer may appear overwhelming. That is why we have defined five cleaning efficiency classes: from a simple rinse to removing the most difficult soil. These individual efficiency classes, information on the tank size and recommended operating pressure allows you to quickly find the most suitable nozzle for your application.

You will find a detailed description of the cleaning efficiency classes on page 18.

Individual advice

It goes without saying that we provide you with personal service on the subject of tank and equipment cleaning and explain the different possibilities to you. Contact us and let us define the best possible solution for the most efficient cleaning.
LECHLER NOZZLES FOR TANK AND EQUIPMENT CLEANING

Cleaning in Place (CIP)

Many of Lechler’s precision nozzles for tank and equipment cleaning are CIP-capable and can remain in the installation during the production process.

For every application

From the easiest to most difficult soils – Lechler has the optimum solution for removing soils of all kinds.
Applications

Hygienic equipment cleaning

Even difficult cleaning tasks with special requirements, such as in the food and beverage industry, can be performed easily with Lechler nozzles.

The right nozzle for every tank

Our extensive product range includes the right nozzle size for every application – from a small test tube to a large fermentation tank for bioethanol production.
The fundamentals of cleaning technology

Sinner’s circle

The Sinner’s circle illustrates the interplay between the four main factors for successful cleaning:
- Chemistry (choice of cleaning agent)
- Mechanical (removal of soil via pressure or friction)
- Temperature (at which cleaning is performed)
- Time (duration of the total cleaning processes)

The proportion of the individual factors as a part of the entire cleaning can be varied, provided that the total is 100 per cent. This results in significant savings potentials.

As a result, the intensification of mechanical cleaning enables the consumption of cleaning agents or the duration of cleaning to be reduced. Consequently, the mechanical factor that takes up a greater part of the Sinner’s circle, while the other factors can end up being reduced.

Cost reduction by efficient cleaning processes

This is precisely where our nozzles and rotating cleaning nozzles come into play, having been specially developed for delivering a high mechanical cleaning action. Their greater efficiency helps to permanently reduce on going costs for energy and cleaning agents, and also the duration of cleaning. Consequently a one-off investment in improved nozzle technology pays for itself after only a short time.

Figure 1: Sinner’s circle with equal proportions of the temperature, time, chemistry and mechanical factors.

Figure 2: Lechler nozzles and rotating cleaning nozzles have high mechanical cleaning efficiency. This reduces the proportion of the other factors, as well as the resulting costs.
Mechanical cleaning effects with Lechler rotating cleaning nozzles

Mechanical cleaning

Rotating cleaning nozzles deliver the greatest impact when cleaning the surface area of the tank. To achieve this, large droplets must strike at high speed. This enables thick soil to be removed that cannot dissolve in the cleaning fluid. Important influencing factors are the distance between the nozzle and wall, and the operating pressure.

If either are too great the fluid will break down into smaller droplets (see Figs. 3 and 4) and the impact will be reduced.

Besides the impact, the fluid running down the tank wall also has a significant cleaning effect. If the formed film is thick enough, the resulting shear stresses can remove light to moderate soil. In that case, unsprayed patches are less of an issue than is the case during impact cleaning (see Fig. 5).

Figure 3: Rotating cleaning nozzles with recommended operating pressure

Figure 4: Rotating cleaning nozzles with operating pressure too high

Figure 5: Cleaning mechanisms, impact and shear stress
**Impact**

The force of impact when using of a liquid jet on a surface plays an important role in cleaning technology. The ratio of the force \( F \) to the surface \( A \) is referred to as the impact \( I \).

\[
I = \frac{\text{Impact force}}{\text{Impact surface}} = \frac{F}{A} \quad \text{bar m}^2\,\text{l/min}
\]

It can be controlled via the following parameters:

- **Impact surface and spray angle (a)**
  The impact surface is the area where the droplet strikes. The smaller the surface area, the greater the impact values. Nozzles with high impact are, for example, solid stream nozzles and flat fan nozzles with a narrow spray angle (see Fig. 6).

- **Flow rate (b)**
  Increasing the flow rate by using a larger nozzle increases the impact, assuming that the other parameters (spray angle, pressure and medium) remain the same (see Fig. 6).

- **Pressure**
  With rotating nozzles, the supply pressure normally influences the rotation speed. The higher the rotation speed, the greater the tendency of rotating nozzles to atomize the fluid into much smaller droplets.

This effect has a negative influence on impact. Lechler rotating cleaning nozzles should therefore be used at the recommended operating pressure range.

**Figure 6:**

- a) Constant pressure and flow rate, variable spray shape and spray distance
- b) Constant pressure, spray shape and spray distance, variable flow rate
Comparison of rotating cleaning nozzles and static spray balls

Due to their simple construction, static spray balls are economical and are likely to miss important areas. Whereas rotating cleaning nozzles spray the entire tank wall in a fan-like pattern, the jets from spray balls strike only in concentrated spots. The remaining surface is simply cleaned by the shear stresses of the fluid running off (see Fig. 7). The fluid consumption is therefore significantly greater in comparison with rotating cleaning nozzles.

Influence of chemistry and temperature

The chemical cleaning effect takes part in almost all tank cleaning applications when the soil is dissolved in the cleaning medium or the bonding between soil and tank surface is reduced. Higher temperatures can support the chemical cleaning effect.

Foam cleaning with nozzles

Foam cleaning is primarily based on the chemical cleaning effect. Since the foam sticks more firmly to the surface, it can be more effective than cleaning fluids that drip off quickly. The mechanical cleaning effect plays a correspondingly subordinate role. Here, the task of the nozzle is to distribute the foam evenly. Your end result for this application depends on the type of foam.

CIP- and SIP-cleaning

Cleaning in Place (CIP) is one of the standard cleaning methods in the food and pharmaceutical industries. This is a process where the cleaning and disinfectant solutions circulate in the production systems during the cleaning process. The nozzles installed in the systems and do not need to be dismounted during the process.

The correct combination of steps from Sinner’s circle leads to a reliable and reproducible process. Almost all Lechler rotating cleaning nozzles and static spray nozzles are capable of CIP. If sterilization is performed after CIP-cleaning with hot water or saturated steam, this is referred to as SIP-cleaning (Sterilization in Place).
_STATIC SPRAY BALLS DO NOT ROTATE AND THEREFORE REQUIRE CONSIDERABLY MORE FLUID. THEY ARE USED PRIMARILY FOR RINSING TANKS. THEY ARE INEXPENSIVE TO PURCHASE AND ARE VERY ROBUST (TROUBLE-FREE).

_FREE-SPINNING_

THE CLEANING FLUID DRIVES THE SPRAY HEAD BY MEANS OF SPECIALLY POSITIONED NOZZLES. THE RAPIDLY REPEATED IMPACTS REMOVE THE SOIL AND RINSES IT FROM THE TANK SURFACE. THIS RESULTS IN OPTIMUM CLEANING EFFICIENCY AT LOW PRESSURES IN SMALL TO MEDIUM-SIZED TANKS.

_CONTROLLRED ROTATION_

THE ROTATING HEAD IS DRIVEN BY THE FLUID. A TURBINE WHEEL WITH AN INTERNAL GEAR IS USED TO CONTROL THE ROTATION. THIS ENSURES THAT THE SPEED REMAINS IN THE OPTIMUM RANGE EVEN AT HIGHER PRESSURES. THE DROPLETS PRODUCED ARE LARGER AND STRIKE THE TANK WALL AT HIGHER SPEED. THESE ROTATING CLEANING NOZZLES thus achieve an even higher impact which is especially for large tanks important.

_GEAR-CONTROLLED_

THE CLEANING FLUID DRIVES AN INTERNAL GEAR BY MEANS OF A TURBINE WHEEL SO THAT THE SPRAY HEAD ROTATES BY TWO AXES. THE SOLID JET NOZZLES MOUNTED ON THE SPRAY HEAD PRODUCE POWERFUL JETS. THESE JETS SWEET THE ENTIRE TANK SURFACE IN A PRE-PROGRAMMED, MODEL-SPECIFIC PATTERN DURING A SPRAY CYCLE. THIS REQUIRES A CERTAIN MINIMUM TIME. THESE MODELS GENERATE THE HIGHEST IMPACT AND ARE THEREFORE IDEAL FOR VERY LARGE TANKS AND THE TOUGHEST CLEANING TASKS.

WHAT YOU SHOULD KEEP IN MIND WHEN PLANNING
Connection options

Lechler offers various options for connecting the rotating cleaning nozzles to the supply line:

**Threaded connection**
Most nozzles have a female thread that is screwed onto a male thread on the pipe.

**Slip-on connection**
Slip-on connections without threads are often preferred in applications with high sanitary requirements. Here, the nozzle is slipped onto the outer pipe and secured through a horizontal hole by a pin or clamp.

**Tri-Clamp**
Tri-Clamp fittings are frequently used in the food and beverage industry. Some rotating cleaning nozzles can be supplied with a compatible adapter.

**Welded connection**
Almost all nozzles are also available with welded connection on request. These are particularly suitable for applications where sanitary requirements have to be taken into account. Please contact us for further information.
WHAT YOU SHOULD KEEP IN MIND WHEN PLANNING

Materials

Lechler tank and equipment cleaning nozzles are made of extremely high-grade materials that are designed to meet high requirements such as resistance to cleaning chemicals or temperature influences. The large choice of different materials – e.g. 316L SS, PVDF, PEEK or PTFE – allows nozzle selection customized to the individual application and operating conditions. In addition, the materials used for the tank and equipment cleaning nozzles are perfectly matched to each other and are thus characterized by very low wear.

The product pages for the individual nozzles provide information on the materials available for the different nozzle types.

In addition to the requirements for material resistance and wear, the materials must also be food grade for use in the beverage, food and pharmaceutical industries. Depending on the application area, the materials must meet different demands.

A large number of the materials used for Lechler tank and equipment cleaning nozzles comply with the requirements of the FDA or conform to (EC) 1935/2004.

Further information on conformity is provided on the product pages.

The FDA, the U.S. Food & Drug Administration, is a federal agency which oversees those two industries. Materials used in making Lechler products are compliant with the requirements of FDA regulation 21 CFR for use in food applications.

The regulation (EC) No. 1935/2004 of the European Parliament regulates general safety requirements to all food and beverage contact materials.

The respective logo on the product pages indicates which requirements are met.

Hygiene requirements

Lechler’s tank and equipment cleaning nozzles are designed so that they meet hygiene requirements.

This is reflected, for example, in the self-draining function, minimized dead space in the nozzles as well as an external design without unnecessary gaps and edges. At the same time, the nozzles are designed with the lowest possible surface roughness.

The 3-A® council is an organization in the USA that defines criteria for the cleanability of components in the dairy and food industry. Components and systems are examined to establish whether germs adhere to surfaces or existing soiling can be removed.

Components and systems are awarded a «3-A® certificate» only if they are easy to clean or if soil cannot be deposited in the first place.

The 3-A® council is an organization that certifies the hygienic design of components. Its procedure is similar to that of 3-A®. The «HygienicWhirly» series is EHEDG-certified.

The respective logo on the product pages indicates which requirements are met.

Nozzle Wear

Nozzle wear depends mainly on the operating conditions.

Like with all rotating parts, the bearing assembly is subjected to the highest amount of stress. The following operating conditions accelerate wear:

- Solids in the fluid and hard particles
- Use in a chemically aggressive environment
- Spraying of chemically aggressive substances
- Operating the nozzle above the recommended pressure range or temperature.

Material certificates

Material certificates in accordance with DIN EN 10204 can be issued on request for almost all Lechler tank and equipment cleaning nozzles.

The respective logo on the product pages indicates which requirements are met.

ATEX

Lechler offers specially designed nozzle series for use in explosive atmospheres. Different nozzle series have an ATEX approval that was issued by an external certification institute.

The respective logo on the product pages indicates which requirements are met.

### p Change in specific weight

\[
\rho_w = \frac{V_2}{V_1} = \frac{V_w}{X} = \rho_w \cdot \frac{\sqrt{p_2}}{\sqrt{p_1}}
\]

\[
\rho_w = \text{Flow rate (water) [l/min, l/h]}
\]

\[
\rho_w = \text{Flow rate of liquid, with a specific weight that differs from 1}
\]

\[
X = \sqrt{\frac{p_2}{p_1}} = \text{Multiplier}
\]

\[
p = \text{Specific weight [kg/m}^3\text{]} 
\]

### p/V Pressure/Flow rate

Valid for single-fluid nozzles and rotating nozzles except for axial-flow full cone nozzles.

\[
V_2 = \sqrt{\frac{p_2}{p_1}} \cdot V_1 = \text{l/min}
\]

\[
\rho_p = \frac{V_2}{V_1} \cdot p_1 = \text{bar}
\]

Valid for axial-flow full cone nozzles.

\[
V_2 = \left(\frac{\rho_w}{\rho_p}\right)^{0.4} \cdot V_1 = \text{l/min}
\]

\[
\rho_p = \left(\frac{V_2}{V_1}\right)^{2.5} \cdot p_1 = \text{bar}
\]

###  All flow rate data of this brochure have been measured with water and consider the individual flow parameters of the nozzle designs.
Nozzle selection

The choice of the right Lechler rotating cleaning nozzle or static spray ball is determined primarily by the type of soil to be cleaned and the tank diameter. You can find this information on the product pages. It must be guaranteed that the diameter of the tank to be cleaned is smaller than the specified maximum possible tank diameter of the nozzles.

Pump and pipes

The pipe size used depends mainly on the required flow rate and should be chosen so that the pressure losses in the pipe system are as low as possible. It must be guaranteed that the required static operating pressure is available directly at the nozzle. The pump power must be matched to this.

Arrangement

The nozzles must be positioned in the upper part of the tank where possible. The following recommendation applies:

\[ H_{\text{nozzle}} = \frac{1}{3} \cdot H_{\text{tank}} \]

In addition, it must be ensured that sufficient cleaning fluid strikes the tank top.

Filling level

If possible, the nozzle should not come into contact with the product during production. The nozzle should be positioned above the maximum product level in the tank.

Tank drainage rate

The tank drainage rate is to be selected to prevent the level of liquid from rising during the cleaning process. Make sure the drain can handle whatever volume you put into the tank.

(See chart on the right)
Number of nozzles

When cleaning large tanks or complex installations, you will need to install several nozzles. The nozzles must be positioned for the spray jets to overlap. These nozzles effectively clean the tank surface area.

Avoidance of spray shadows

Installations such as agitators, baffle plates or pipes prevent the areas behind them from being reached directly by the spray jet. Impact cleaning is not possible in these locations. For this reason, several nozzles must be installed if the tank contains equipment such as agitators or pipes. The number of nozzles should be chosen so that the spray shadows of the individual nozzles are eliminated. In addition, static spray nozzles can also be used for targeted removal of deposits left as a result of spray shadows or in areas that are difficult to clean.
PERFECT FOR RELIABLE PLANNING
TankClean SIMULATION SOFTWARE

Planing for a perfect clean tank can be a challenge. Many tanks have built-in equipment such as agitators or baffles which can create spray shadows. Whether a certain nozzle is able to reliably clean all surfaces of the tank under these conditions cannot be decided with certainty on the basis of just a visual inspection.

With our new and unique TankClean software, we can help you to find the optimum solution for perfectly cleaning your tank. To do this, we replicate the tank geometry in the software and then simulate the spraying operation. Operation of all Lechler tank cleaning nozzles can be simulated – from the static spray ball to the high-impact tank cleaning machine. The result of the simulation is documented and provided in a PDF or video file. Simulation with TankClean can already be used as the basis for optimum cleaning in the planning phase of new tanks, but is also suitable for optimizing existing tank cleaning processes.

Our unique service – your individual benefit

**Planning certainty**
We assist you in planning your tank cleaning solution to ensure cleaning without any gaps.

**Process optimization**
By simulating the existing cleaning processes, we show you the optimization potentials for these processes.

**Process reliability**
Thanks to realistic and individually customized process simulation, we can offer you individual solution concepts.

**Cost and time savings**
Simulation makes it possible to detect any potential problem areas before final definition of the cleaning concept. This makes it possible to significantly reduce the number of time- and cost-intensive practical cleaning tests.
Planning aids

Individual adaptation of tank geometries and built-in equipment

Selection of the right tank cleaning nozzles

Realistic simulation of the cleaning process

Documentation of the simulation results, including additional planning aids

Talk to us

Are you interested in tank cleaning simulations with TankClean? Ask your Lechler contact person for further information or give us a call. We will gladly help you in planning your tank cleaning solution.
Lechler precision nozzles for tank and equipment cleaning are divided into different cleaning efficiency classes. A distinction is made between five different cleaning efficiency classes.

The subdivision into cleaning efficiency classes 1-5 is intended to facilitate nozzle selection for users. These classes make it possible to find the right nozzle for the respective application.

First, the required cleaning efficiency class is defined on the basis of the soil type – rinsing, light to medium soil, persistent soil. Several classes are generally always suitable for one type of soiling. It is not possible or expedient to differentiate exactly between the soil types or recommended nozzle types since there are a large number of different applications. The information should be seen as recommendations intended to make it easier to choose the right nozzle.

If your application is to clean a non-adhering powder material from a tank surface, for example, the cleaning task can be defined as „rinsing“.

The nozzle series in cleaning efficiency class 1, e.g. static spray ball, or class 2, e.g. »MicroWhirly« or »MiniSpinner«, are suitable for this.

In the next step, the maximum possible tank diameter and the flow rate range of the individual series are considered. Lechler static spray balls are very economical. For cleaning medium soil, Lechler MicroSpinners or MiniSpinners are recommended.

However, it is also possible that there will be no nozzle series from the two cleaning efficiency classes that is suitable at first sight in the case of very large tanks. To check this, it is recommended to refer to the overview page of the respective cleaning efficiency class. Using the number line, it is possible to see at a glance whether there is a suitable series for the specific tank diameter in the corresponding cleaning efficiency class. The following possibilities exist if there is no recommended series for the required tank diameter:

- Several nozzles are positioned in the tank so that the distance between nozzle and tank is within the required dimensions.
- By referring to the overview pages of the different cleaning efficiency classes, choose a suitable nozzle series for the respective tank diameter.

In addition to the classes described above, there is also an additional subdivision into static cleaning nozzles. These include flat fan or full cone nozzles, for example. These can be used for the shadowing effect to provide complete spray coverage.

### Cleaning efficiency class 1

These static spray balls of cleaning efficiency class 1 are designed for hygienic rinsing with a flow rate of 15 to 670 l/min at 2 bar, as is frequently required in the food and beverage industry. In addition to liquid media, the static spray balls can also be operated with media such as steam and air and therefore are especially suitable for SIP cleaning (Sterilization in Place).

Lechler products in this class are also designed for operation at higher temperatures and guarantee high process reliability.

Series 527

The 3A® certification also makes the products of series 527 suitable for areas with the highest of hygiene requirements. They clean with powerful solid jets, have a high surface quality and are also reliably resistant to high temperatures.

Overview of the tank diameter, depending upon the pressure of series 527
In most applications, static spray balls do not deliver the same cleaning power as rotating nozzles, anyway they do have advantages that make them indispensable for certain tasks:

- No moving parts
- Self-draining
- Easy to inspect
- Proven use in hygienically sensitive environments

Should a rotating nozzle stop turning for some reason, parts of the tank may remain uncleaned. This cannot happen with spray balls. However, gaps can occur in the spray pattern if individual openings are blocked with soil.

Compared to rotating nozzles, static spray balls usually need two to three times the amount of liquid.

The maximum tank diameter shown above applies for the recommended operating pressure and is indicative only. The cleaning result is also affected by the type of soiling.

### Slip-on information

- Cotter pin made of 316L SS is included.
- Depending on diameter of adapter, the flow rate can increase due to leakage between connecting pipe and static spray ball.

---

The content includes tables and diagrams related to static spray balls, detailing dimensions, spray angles, and connection options according to various standards. It also provides information on slip-on connections and cleaning results, with notes on operational conditions and leakage effects. The text is structured to facilitate easy navigation through the specifications and application details for the Series 5B2/5B3.

PERFECT RINSING AND REMOVAL OF LIGHT SOILING

Cleaning efficiency class 2

The typical task profile of the rotating nozzles in cleaning efficiency class 2 includes rinsing tasks and the removal of light soiling, particularly the kind that frequently occurs in the food and beverage industry as well as in the chemical and pharmaceutical industry.

The Lechler products in this class are free-spinning and made from particularly high-grade materials such as stainless steel, PVDF, PEEK and PTFE. This ensures the use of a wide range of different cleaning agents.
Series 500.234

The PicoWhirly works with rotating solid jets and is also suitable for cleaning at very high temperatures. This rotating cleaning nozzle with kolsterised slide bearing is made entirely from stainless steel and can also be used in very small spaces, thanks to its extremely compact construction.

### Specifications

- **Material**: 316L SS
- **Max. temperature**: 200 °C
- **Recommended operating pressure**: 3 bar
- **Installation**: Operation in every direction is possible
- **Filtration**: Line strainer with a mesh size of 0.3 mm/50 mesh
- **Bearing**: Kolsterised slide bearing

### Information on operation

- Operation with compressed air only for short-term usage.
- Operation above the recommended operating pressure has negative effects on the cleaning result and wear.

The maximum tank diameter shown above applies for the recommended operating pressure and is indicative only. The cleaning result is also affected by the type of soiling.
Series 566

The MicroWhirly, with effective flat fan nozzles, is licensed for contact with food. Thanks to the robust slide bearing made from PEEK, the MicroWhirly has a particularly long service life. The MicroWhirly is alternatively available with an internal or external thread and in an ATEX version, which allows it to be adapted to a wide range of uses.

**Materials**
- 316L SS, PEEK, PEEK ESD (ATEX version only)

**Max. temperature**
- 130 °C
- 90 °C ATEX Version

**Recommended operating pressure**
- 2 bar

**Installation**
- Operation in every direction is possible

**Filtration**
- Line strainer with a mesh size of 0.3 mm/50 mesh, 0.2 mm/80 mesh ATEX Version

**Bearing**
- Slide bearing made of PEEK

**Example of ordering:**
- Type/Ordering no. 5NA.879.1Y.AB.EX
Rotating cleaning nozzle »MicroSpinner«
Series 5MC

The innovative slot design gives the MicroSpinner its high degree of effectiveness. Due to the modern bearing construction, it is particularly reliable and durable. The MicroSpinner is made entirely from stainless steel and designed for use also at high temperatures. Apart from stainless steel, it is also available in Hastelloy and in many flow rates.

Materials
- 316L SS, 440C SS
- Hastelloy C22,
- Hastelloy C276

Max. temperature
140 °C

Recommended operating pressure
2 bar

Installation
Operation in every direction is possible

Filtration
Line strainer with a mesh size of 0.1 mm/170 Mesh

Bearing
Double ball bearing made of 440C SS
Double ball bearing made of C276

Series 573/583

The PTFE Whirly is of particular interest for applications in the chemical, pharmaceutical and food industries. It works with rotating solid jets and is suitable for use in corrosive environments. The slip-on connection has a 3A® certification and can be used in areas subject to particularly high hygiene requirements, such as contact with food.

Pop-up rotating cleaning nozzles »PopUp Whirly«
Series 5P2/5P3

When a certain fluid pressure is reached, the rotating cleaning nozzle of PopUp Whirly is automatically extended from the enclosure. These free-spinning rotating nozzles can be installed flush in the tank wall. They are also suitable for cleaning pipes and for applications that use foam. They are of particular interest for applications in the food and beverage industry as well as for the pharmaceutical and chemical industry.

EFFICIENT REMOVAL OF LIGHT AND MEDIUM SOILING

Cleaning efficiency class 3

Due to their special nozzle geometry and flow rates from 11 to 639 l/min at 2 bar, the rotating nozzles in efficiency class 3 are suitable for cleaning medium soiling from tanks and equipment. Such soiling is especially found in the food and beverage industry, but also in the chemical and pharmaceutical industry. The free-spinning rotating nozzles in class 3 are made from especially high-grade materials and are available in tank sizes from small to large.

The EHEDG-certified HygienicWhirly is perfectly suited for hygienically sensitive areas and can also be used for the output of foam.

The Whirly series is also available as an ATEX version and can therefore also be used in explosive environments.

### Information on Operation

- Operation with compressed air only for short-term usage. Operation above the recommended operating pressure has negative effects on the cleaning result and wear.

Example for Ordering: Type + Connection = Ordering no.

- Type 577.283.1Y + AN = 577.283.1Y.AN

The maximum tank diameter shown above applies for the recommended operating pressure and is indicative only. The cleaning result is also affected by the type of soiling.
EFFECTIVE REMOVAL 
OF HEAVY SOILING

Cleaning efficiency class 4

The Lechler products in this class have controlled rotating cleaning nozzles. They are suitable for contact with food and the cleaning of large tanks. The cleaning nozzles of cleaning efficiency class 4 are available in many different sizes and flow rates.

The efficient flat spray nozzle geometry of the rotating cleaners in cleaning efficiency class 4 ensures the removal of heavy soiling at temperatures of up to 140 °C. Process reliability is increased through combination with the Lechler rotation monitoring sensor.

Max. tank diameter [m] 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9

Operating principles
Controlled rotation

Flow rates at 2 bar
25 to 300 l/min

Recommended operating pressures
3 to 5 bar

Max. temperatures
95 to 140 °C
Series 5S2/5S3

Specially developed flat fan nozzles provide high impact and uniform cleaning for the XactClean® HP. The controlled rotation ensures that the XactClean® HP works extremely efficient. Thanks to the robust drive unit the XactClean® HP is very reliable and ensures increased operation liability. It is available in various spray angles and flow rates and is also compatible with the Lechler rotating monitoring sensor.

Example of ordering: 5S2.953.1Y.XX.EX + AL = 5S2.953.1Y.AL.EX

Example of ordering with FDA and (EC) 1935/2004 conformity.

All Materials are suitable for contact with food.

Example of ordering slip-on connection: 5S2.953.1Y.T5.EX

Attention: for the ATEX version of the slip-on connection the code for the connection changes. 1/2" slip-on: T5 - 3/4" slip-on: T7
Cleaning processes can be easily and reliably monitored with the Lechler rotation monitoring sensor. The sensor records the quantity of liquid flowing over the sensor tip. With the aid of the software*, the sensor function can be specifically adjusted to the tank size, pressure and nozzle.

**Electrical data**
- Supply voltage: $U_b = 24\,V \pm \pm 20\%$ (18 to 32 VDC)
- Power requirements: < 20 mA
- Output signal: PNP, 50 mA short circuit protected, active

**Operating conditions**
- Ambient temperature: $-10^\circ$ up to $+60^\circ$C
- Process temperature: 0° up to +100°C

**Materials**
- Socket (G 1/2"): 316L SS
- Probe tip: PEEK
- Body: 303 SS

**Ordering data**
- Rotation monitoring sensor with weld-in sleeve: 050.040.00.00.00.0
- Cable set for first-time operation: 050.040.00.00.01.0

**Operating principle**
- Capacitive

**Advantages**
- Reliable recognition of any faults during the cleaning cycle
- The process connection of the sensor is in compliance with the hygiene guidelines of the EHEDG
- Simple operation
- Can be connected to PLC
- Only needs to be set up once using the software provided
- Can be specifically adapted to each cleaning task

* Software download (free of charge): www.lechler.com/software/rotationcontrolsystem
Series 5S5

The XactClean® HP+ provides uniform cleaning and high impact, thanks to specially developed flat fan nozzles. Controlled rotation, along with higher flow rates, ensures effective results, especially in larger tanks. The robust drive unit makes the XactClean® HP+ extremely dependable and increases operational reliability. This nozzle is compatible with the Lechler rotation monitoring sensor, making it easy to oversee the cleaning process.

Cleaning efficiency class 5

Persistent soiling requires special measures. That’s why the Lechler high impact tank cleaning nozzles in efficiency class 5 are equipped with high-grade gear units and work with deliberately controlled rotation. They prove their capabilities in tasks in the food and beverage industry, the chemical and petrochemical industry and the paper industry.

Solid jet nozzles ensure maximum efficiency and maximum impact. Cleaning efficiency class 5 includes rotating cleaners that are suitable for medium to very large tanks. Process reliability is increased through combination with the Lechler rotation monitoring sensor.

**Operating principles**
- Gear-controlled

**Flow rates**

**THE EFFECTIVE MEDIUM AGAINST THE MOST PERSISTENT SOILING**
Series 5TA

The IntenseClean Hygienic 5TA is a permanent feature, especially in the pharmaceutical, food and beverage industries. It is extremely effective thanks to the particularly powerful solid jet nozzles and is also suitable for small tanks with persistent soiling. The series can resist pressures of up to 15 bar and high temperatures without any problem. All parts used exhibit a particularly high surface quality.

»IntenseClean Hygienic«
Series 5TB

Series 5TB
The IntenseClean Hygienic 5TB has firmly established itself, above all in the pharmaceutical, food and beverage industries – and with good reason: The especially strong solid jets produce an extremely high degree of effectiveness, while the gear-controlled rotation ensures high levels of efficiency. All parts used are noted for their particularly high surface quality. This series is suitable for high pressures and temperatures.

Rotation monitoring sensor
Sensor compatible, Info: see page 74

Overview of the tank diameter, depending upon the pressure of series 5TM
E = narrowest free cross-section

The maximum tank diameter shown above applies for the recommended operating pressure and is indicative only. The cleaning result is also affected by the type of soiling.
Cleaning processes can be easily and reliably monitored with the Lechler rotation monitoring sensor. The sensor records the quantity of liquid flowing over the sensor tip. With the aid of the software*, the sensor function can be specifically adjusted to the tank size, pressure and nozzle.

**Electrical data**
- Supply voltage: $U_b = 24\ V \pm 20\%$
  (18 to 32 VDC)
- Power requirements: $< 20\ mA$
- Output signal: PNP, 50 mA short circuit protected, active

**Operating conditions**
- Ambient temperature: -10° up to +60°C
- Process temperature: 0° up to +100°C

**Materials**
- Socket (G 1/2"): 316L SS
- Probe tip: PEEK
- Body: 303 SS

**Advantages**
- Reliable recognition of any faults during the cleaning cycle
- The process connection of the sensor is in compliance with the hygiene guidelines of the EHEDG
- Simple operation
- Can be connected to PLC
- Only needs to be set up once using the software provided
- Can be specifically adapted to each cleaning task

FOR SPECIAL REQUIREMENTS: OUR STATIC CLEANING NOZZLES

Static cleaning nozzles

The range of applications of the static cleaning nozzles in the support of rotating cleaners focuses on particularly difficult tasks, such as equipment cleaning and the avoidance of spray shadows. They deliberately support the cleaning efficiency of the process and are used in addition to rotating cleaners or spray balls to reach hard to access places and for removing persistent soiling.
Axial-flow full cone nozzles
Series 490/491

Non-clogging nozzle design. Stable spray angle. Particularly even liquid distribution.

Subject to technical modification. In a critical installation situation, please ask for the exact dimensions.

YOU CAN FIND MORE NOZZLES IN OUR STANDARD CATALOGUE …

The catalogue „Precision Spray Nozzles and Accessories“ is a sought-after manual of nozzle technology.

It contains valuable working aids and extensive technical information on Lechler products and ordering instructions.

... AND IN OUR INDUSTRY BROCHURES

Information is available for various industries in special industry brochures.

All documents can be downloaded from our website at www.lechler.com. We would also be happy to send you the brochures.
THE IDEAL SOLUTION TO THE PERFECT NOZZLE

NOZZLE SELECTION QUESTIONNAIRE

Nobody knows your process and requirements better than you. Your knowledge is critical to us in order to find the optimal nozzle for your application.

Simply fax us the completed questionnaire or enter your information online.

www.lechler.com/tankcleaning/questionnaire_tankcleaning

FULL INFORMATION IS JUST A CLICK AWAY: THE LECHLER WEBSITE

Our website contains further information on our products as well as useful resources. In addition to technical data, there is also a product finder to help you in your search for the right nozzle.

www.lechler.com

3D DESIGN DATA FOR YOUR WORK

So you can work on your designs with reliable data from the outset, free 3D data on Lechler nozzles and accessories are available to you online.

Your advantages:
- Time-saving, immediate download of design drawings and technical data
- Simple, fast product selection
- Preview function with product photo and 3D graphics
- All popular 3D formats available
- Free use following one-time registration
